

## What's New (User Guide pages in parenthesis)

### Improvements

- You can now export Follow-up Flag reasons and notes for monitorees using the Custom Export feature. When using the Custom Export builder, the available data elements can be found in: Monitoree Details /Monitoring Info/Follow-up Flag.
- Updated the minimum required data needed to save a lab result to a monitoree's record. You will now be required to include, at a minimum, a Result and either a Specimen Collection Date or a Report Date (page 97).
- "Fully Vaccinated" is now an available option as a Reason for Closure when closing a monitoree's record (page 38).
- You can now use the Advanced Filter feature to find records with a "blank" or no data in the following fields: Last Date of Exposure, Symptom Onset Date, Latest Report, Lab Result (Specimen Collection Date, Result, Type, Report Date), and Vaccination (Administration Date) (page 69).
- You can now import up to two vaccinations per monitoree using the Sara Alert Import Format. The Import Format template has been updated to include new columns for vaccinations. Group Name and Product Name are required when importing vaccinations. **Make sure to download and use the updated Import Format following the release of v1.33 to avoid import errors.**

### Usability and Performance

- Minors are now more easily identifiable in the system. If a monitoree is a minor, red text indicating their minor status now appears in the Identification and Contact Information columns of the Monitoree Details section of their record. If the minor is in a Household, a link to their Head of Household's record will appear in the Contact Information column. Minor records are now also indicated on the Monitoring Dashboards with an icon in the Date of Birth column.
- Record rows that you have selected on the Monitoring Dashboards are now shaded with a blue color to make them more easily distinguishable from unselected records.
- The change in shading that occurs when you hover your mouse over a row in the Monitoring Dashboards is now more pronounced.
- The page title of the browser tab or window running Sara Alert now matches your current view.

### Fixes

- Fixed an issue where users were unable to clear one or more monitorees' Assigned User number using the Bulk Actions feature.
- The "This case does not have a Symptom Onset Date or positive lab result and may never become eligible to end monitoring" warning has been removed from records in the Exposure workflow.
- Fixed a minor bug where a monitoree's own record appeared as an option when using the "Move to Household" feature.

## User Documentation

### Updates

- Minor updates only.

## API

### Overall Improvements

- Minor updates only. See full [API Release Notes](#) for more details.

## Announcements

- Release 1.34 is scheduled for deployment to production on July 27 at 10pm EDT.
